

# Cedar for Development Testing

Cedar for Development Testing

An inhouse solution for testing:

New Technologies  
and New products

Case: New product implementation  
needs to be tested with accurate operator test data and get User Acceptance Tested as quick as possible to meet  
business targets

Problem: Large numbers of CDRs/xDRs (usage data) covering all types of calls is  
not available in pre-production and test data is not automated.

Solution: CeDaR generates all volumes and tariff  
complexities in test CDRs/xDRS and automatically runs these through the billing system with full comparison options to  
check the  
billing process accuracy. All usage scenarios are tested in large volumes and the new product is launched with revenue  
being accurately generated from the word GO
