

Cedar for Test Automation

Cedar for Test Automation

A best of breed application for comprehensive billing testing in both test environments and risk free testing in production:

- for fast expanding networks that require testing the billing of new products or network elements as the capacity and user base expands

- Finding
test records and correlating large volume test scenarios with CDRs/xDRs (usage data) without any programming work or any implications for the transmission network

- When resources or skills are not available for adequate testing

- A solution for checking the accuracy of both pre and post pay billing systems

- provides a graphical user
interface for analysis and statistical reporting throughout your organization

- Using CeDaR traditional testing becomes much easier, faster and cost-effective
